# Goodbye copper. Hello clever, cable-free connectivity.

Intelligent mobile connectivity PSTN replacement services:  
Built for businesses, designed for the future.

# The UK's copper analogue phone network, known as the PSTN, is retiring.

Over the past 100 years the PSTN has kept the UK connected—but it's become an inefficient and expensive mess to look after. And copper cables just don't make the cut when it comes to the demands of 21st century technology.

So Openreach is switching it all off.

Openreach's alternative?

**SoGEA**

The same old copper lines running a slow, unreliable service.

Our alternative?

**Intelligent mobile connectivity**

A fast, reliable, and seriously smart service.

## Intelligent mobile connectivity: A faster, more reliable, and seriously smart service.

### Unrivalled reliability

No downtime, no lost connections —just always-on connectivity.

Unlike SoGEA, wireless connectivity can't be cut. And with all four UK networks in a single SIM, your devices will automatically switch to the next strongest network in the event of an outage.

### Security you can be sure of

Protect devices from misuse and malware with artificial intelligence.

Smart device pairing stops SIMs being repurposed in places they shouldn't be, while our AI powered, network level content filtering adds layer upon layer of protection from malware and device abuse.

### Complete visibility and control

Manage and monitor everything at the touch of a button.

Say goodbye to trekking out to devices to see what's going on. Instead, monitor your connectivity remotely and make changes on the fly with a suite of effortless management tools. That's something SoGEA can't do.

### Designed for the future, tailored to your tech

Swap rigid, as-it-comes cable connectivity for endless flexibility, and be ready for the future of connectivity.

We'll build and scale connectivity your way, with endless customisation options and intelligent add-ons. And we'll support you the whole way, from design, deployment, and whatever comes next.

### Effortless installation, easy configuration

Skip the wait and connect devices right now.

No waiting months for installations. No digging up roads to fit new cables or repair old ones. No need for a team of engineers to wade through a jungle of cables. Just grab a SIM, pop it in, and you're online. Easy.

### High performing, ultra-fast speeds

Take on even the most bandwidth hungry applications.

5G can easily outperform fixed-line services, with speeds surpassing 100Mbps. And best of all, all our services run on business grade networks, meaning absolutely no bandwidth restrictions. Ever.

# Cut the cables and make the switch to intelligent mobile connectivity

## Intelligent 4G

### Best for:

Traditional IoT solutions like alarms, telehealth, traffic lights, lifts, cash machines.

## Intelligent unlimited 5G

### Best for:

Bandwidth hungry services like CCTV, primary connectivity, Mobile WAN.

## Both come with:

### Intelligent SIMs

- Single network
- Unsteered multi-network
- Business grade connectivity
- Fully managed
- Global coverage
- Any amount of data
- Any amount of SIMs
- Flexible contracts
- Static or dynamic IPs

### Intelligent add-ons

- Self regulating tariffs
- Data aggregation for multiple devices
- Smart device pairing
- AI powered, network level content filtering
- Local phone numbers

### All with end-to-end, 24/7 support
